INDUSTRIAL AUTOMATION

Safety Information

Important Information

NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, service, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a “Danger” or “Warning” safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER
DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.
WARNING
WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.
CAUTION
CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
INDUSTRIAL NOTICE
NOTICE is used to address practices not related to physical injury.

PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

Qualification Of Personnel

Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation are authorized to work on and with this product. In addition, these persons must have received safety training to recognize and avoid hazards involved. These persons must have sufficient technical training, knowledge and experience and be able to foresee and detect potential hazards that may be caused by using the product, by changing the settings and by the mechanical, electrical and electronic equipment of the entire system in which the product is used. All persons working on and with the product must be fully familiar with all applicable standards, directives, and accident prevention regulations when performing such work.

Intended Use

This product is a drive for three-phase synchronous, reluctance and asynchronous motors and intended for industrial use according to this manual. The product may only be used in compliance with all applicable safety standard and local regulations and directives, the specified requirements and the technical data. The product must be installed outside the hazardous ATEX zone. Prior to using the product, you must perform a risk assessment in view of the planned application. Based on the results, the appropriate safety measures must be implemented. Since the product is used as a component in an entire system, you must ensure the safety of persons by means of the design of this entire system (for example, machine design). Any use other than the use explicitly permitted is prohibited and can result in hazards.

Product Related Information

Read and understand these instructions before performing any procedure with this drive.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation and who have received safety training to recognize and avoid hazards involved are authorized to work on and with this drive system. Installation, adjustment, repair and maintenance must be performed by qualified personnel.
- The system integrator is responsible for compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
- Many components of the product, including the printed circuit boards, operate with mains voltage.
- Only use properly rated, electrically insulated tools and measuring equipment.
- Do not touch unshielded components or terminals with voltage present.
- Motors can generate voltage when the shaft is rotated. Prior to performing any type of work on the drive system, block the motor shaft to prevent rotation.
- AC voltage can couple voltage to unused conductors in the motor cable. Insulate both ends of unused conductors of the motor cable.
- Do not short across the DC bus terminals or the DC bus capacitors or the braking resistor terminals.
- Before performing work on the drive system:
 - Disconnect all power, including external control power that may be present. Take into account that the circuit breaker or main switch does not de-energize all circuits.
 - Place a **Do Not Turn On** label on all power switches related to the drive system.
 - Lock all power switches in the open position.
 - Wait 15 minutes to allow the DC bus capacitors to discharge.
 - Follow the instructions given in the chapter "Verifying the Absence of Voltage" in the installation manual of the product.
- Before applying voltage to the drive system:
 - Verify that the work has been completed and that the entire installation cannot cause hazards.
 - If the mains input terminals and the motor output terminals have been grounded and short-circuited, remove the ground and the short circuits on the mains input terminals and the motor output terminals.
 - Verify proper grounding of all equipment.
 - Verify that all protective equipment such as covers, doors, grids is installed and/or closed.

Failure to follow these instructions will result in death or serious injury.

Damaged products or accessories may cause electric shock or unanticipated equipment operation.

DANGER

ELECTRIC SHOCK OR UNANTICIPATED EQUIPMENT OPERATION

Do not use damaged products or accessories.

Failure to follow these instructions will result in death or serious injury.

Contact your local Schneider Electric sales office if you detect any damage whatsoever.

This equipment has been designed to operate outside of any hazardous location. Only install this equipment in zones known to be free of a hazardous atmosphere.

DANGER

POTENTIAL FOR EXPLOSION

Install and use this equipment in non-hazardous locations only.

Failure to follow these instructions will result in death or serious injury.

Your application consists of a whole range of different interrelated mechanical, electrical, and electronic components, the drive being just one part of the application. The drive by itself is neither intended to nor capable of providing the entire functionality to meet all safety-related requirements that apply to your application. Depending on the application and the corresponding risk assessment to be conducted by you, a whole variety of additional equipment is required such as, but not limited to, external encoders, external brakes, external monitoring devices, guards, etc.

As a designer/manufacturer of machines, you must be familiar with and observe all standards that apply to your machine. You must conduct a risk assessment and determine the appropriate Performance Level (PL) and/or Safety Integrity Level (SIL) and design and build your machine in compliance with all applicable standards. In doing so, you must consider the interrelation of all components of the machine. In addition, you must provide instructions for use that enable the user of your machine to perform any type of work on and with the machine such as operation and maintenance in a safe manner.

The present document assumes that you are fully aware of all normative standards and requirements that apply to your application. Since the drive cannot provide all safety-related functionality for your entire application, you must ensure that the required Performance Level and/or Safety Integrity Level is reached by installing all necessary additional equipment.

WARNING

INSUFFICIENT PERFORMANCE LEVEL/SAFETY INTEGRITY LEVEL AND/OR UNINTENDED EQUIPMENT OPERATION

- Conduct a risk assessment according to EN ISO 12100 and all other standards that apply to your application.
- Use redundant components and/or control paths for all critical control functions identified in your risk assessment.
- If moving loads can result in hazards, for example, slipping or falling loads, operate the drive in closed loop mode.
- Verify that the service life of all individual components used in your application is sufficient for the intended service life of your overall application.
- Perform extensive commissioning tests for all potential error situations to verify the effectiveness of the safety-related functions and monitoring functions implemented, for example, but not limited to, speed monitoring by means of encoders, short circuit monitoring for all connected equipment, correct operation of brakes and guards.
- Perform extensive commissioning tests for all potential error situations to verify that the load can be brought to a safe stop under all conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

A specific application note [NHA80973](#) is available on hoisting machines and can be downloaded on [se.com](#).

Drive systems may perform unexpected movements because of incorrect wiring, incorrect settings, incorrect data or other errors.

⚠ WARNING

UNANTICIPATED EQUIPMENT OPERATION

- Carefully install the wiring in accordance with the EMC requirements.
- Do not operate the product with unknown or unsuitable settings or data.
- Perform a comprehensive commissioning test.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

⚠ WARNING

LOSS OF CONTROL

- The designer of any control scheme must consider the potential failure modes of control paths and, for critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop, overtravel stop, power outage and restart.
- Separate or redundant control paths must be provided for critical control functions.
- System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- Observe all accident prevention regulations and local safety guidelines (1).
- Each implementation of the product must be individually and thoroughly tested for proper operation before being placed into service.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

(1) For USA: Additional information, refer to NEMA ICS 1.1 (latest edition), Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control and to NEMA ICS 7.1 (latest edition), Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable-Speed Drive Systems.

The temperature of the products described in this manual may exceed 80 °C (176 °F) during operation.

⚠ WARNING

HOT SURFACES

- Ensure that any contact with hot surfaces is avoided.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the product has sufficiently cooled down before handling it.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTICE

DESTRUCTION DUE TO INCORRECT MAINS VOLTAGE

Before switching on and configuring the product, verify that it is approved for the mains voltage.

Failure to follow these instructions can result in equipment damage.

Document Scope

The purpose of this document is:

- to give you mechanical and electrical information related to the Altivar 340 drive,
- to show you how to install and wire this drive.

Validity Note

Original instructions and information given in the present document have been written in English (before optional translation).

This documentation is valid for the Altivar Machine ATV340 drive.

The technical characteristics of the devices described in the present document also appear online. To access the information online:

Step	Action
1	Go to the Schneider Electric home page www.schneider-electric.com .
2	In the Search box type the reference of a product or the name of a product range. <ul style="list-style-type: none">• Do not include blank spaces in the reference or product range.• To get information on grouping similar modules, use asterisks (*).
3	If you entered a reference, go to the Product Datasheets search results and click on the reference that interests you. If you entered the name of a product range, go to the Product Ranges search results and click on the product range that interests you.
4	If more than one reference appears in the Products search results, click on the reference that interests you.
5	Depending on the size of your screen, you may need to scroll down to see the datasheet.

Terminology

The technical terms, terminology, and the corresponding descriptions in this manual normally use the terms or definitions in the relevant standards.

The technical terms, terminology, and the corresponding descriptions in this manual normally use the terms or definitions in the relevant standards.

Among others, these standards include:

- IEC 61800 series: Adjustable speed electrical power drive systems
- IEC 61508 Ed.2 series: Functional safety of electrical/electronic/programmable electronic safety-related
- EN 954-1 Safety of machinery - Safety related parts of control systems
- EN ISO 13849-1 & 2 Safety of machinery - Safety related parts of control systems.
- IEC 61158 series: Industrial communication networks - Fieldbus specifications
- IEC 61784 series: Industrial communication networks - Profiles
- IEC 60204-1: Safety of machinery - Electrical equipment of machines – Part 1: General requirements

In addition, the term **zone of operation** is used in conjunction with the description of specific hazards, and is defined as it is for a **hazard zone** or **danger zone** in the EC Machinery Directive (2006/42/EC) and in ISO 12100-1.

INDUSTRIAL AUTOMATION

Verifying the Absence of Voltage

Instructions

The DC bus voltage level is determined by measuring the voltage between the DC bus terminals PA/+ and PC/-.

The location of the DC bus terminals depends on the drive model.

Identify your drive model by referring to the nameplate of the drive. Then, refer to the chapter "Wiring the Power Part" (*see page 82*) for the location of the DC bus terminals PA/+ and PC/-.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation and who have received safety training to recognize and avoid hazards involved are authorized to work on and with this drive system.  - Verify that the work has been completed and that the entire installation cannot cause hazards.
 - If the mains input terminals and the motor output terminals have been grounded and short-circuited, remove the ground and the short circuits on the mains input terminals and the motor output terminals.
 - Verify proper grounding of all equipment.
 - Verify that all protective equipment such as covers, doors, grids is installed and/or closed.

Failure to follow these instructions will result in death or serious injury.

Procedure

Perform the following actions to verify the absence of voltage

Step	Action
1	Measure the voltage on the DC bus between the DC bus terminals (PA/+ and PC/-) using a properly rated voltmeter to verify that the voltage is less than 42 Vdc
2	If the DC bus capacitors do not discharge properly, contact your local Schneider Electric representative. Do not repair or operate the product.
3	Verify that no other voltage is present in the drive system.

Drive Overview

The Range

ATV340 is available in 5 frame sizes.

Frame Sizes 1, 2 and 3

Frame Size 1, 2 and 3 are available in 3 versions.

Accessories and Options

Introduction

The Altivar Machine ATV340 drives are designed to take numerous accessories and options to increase their functionality. For a detailed description and catalog numbers, refer to the Catalog on www.schneider-electric.com

All accessories and options come with an instruction sheet to help installation and commissioning. Therefore you will only find here a short product description.

Accessories

Drive

- Fan replacement kit
- EMC kits
- Connector kits for I/O, motor and power connection
- Control cables
- Daisy chain DC bus sharing cable

Display terminals

- Plain Text Display Terminal for direct or remote mounting ([VW3A1113](#))
- Graphic Display Terminal ([VW3A1111](#)) with a cable (frame sizes 1...3), for extended mounting
- Remote mounting kit for mounting on enclosure door
- Multidrop connection accessories for connecting several drives to the RJ45 terminal port

Drive mounting kits

- Flush mounting kit ([see page 49](#)) for separate air flow

Modbus Communication tools

- Wi-Fi dongle
- Bluetooth dongle
- USB to Modbus adapter

Options

Encoder interface modules

- Resolver encoder interface module
- Digital interface encoder module 5/12 V
- Analog interface encoder module

Additional Module Support for frame sizes 4 and 5 (slot C) ([see page 17](#))

Safety functions module

I/O extension modules

- Digital and analog I/O module
- Relay output module

Communication modules

- CANopen daisy chain
- CANopen SUB-D
- CANopen screw terminal block
- PROFINET
- PROFIBUS DP V1
- DeviceNet
- EtherCAT

Braking resistors

Mains Chokes

EMC filters

Display Terminals

Introduction

The drive is compatible with the Plain Text Display Terminal ([VW3A1113](#)) or with the Graphic Display Terminal ([VW3A1111](#)). These display terminals can be ordered separately.

Refer to the ATV340 Programming manual ([see page 10](#)) for further operation details.

Description of the Plain Text Display Terminal (VW3A1113)

The Plain Text Display Terminal is a local control unit which can be either plugged on the drive or mounted on the door of an enclosure with its dedicated door mounting kit ([VW3A1114](#)).

- 1 **STOP / RESET:** Stop command / apply a Fault Reset.
- 2 **ESC:** used to quit a menu/parameter or remove the currently displayed value in order to revert to the previous value retained in the memory
- 3 **Graphic display.**
- 4 **Home:** access directly the home page.
- 5 **RUN:** executes the function assuming it has been configured.
- 6 **Touch wheel / OK:** used to save the current value or access the selected menu/parameter. The touch wheel is used to scroll fast into the menus. Up/down arrows are used for precise selections, right/left arrows are used to select digits when setting a numerical value of a parameter.

NOTE: Keys 1, 5 and 6 can be used to control the drive if control via the Display Terminal is activated. To activate the keys on the Display Terminal, you first need to set **[Ref Freq 1 Config] F r 1** to **[Ref.Freq-Rmt.Term] L C C**.

Description of the Graphic Display Terminal (VW3A1111)

The Graphic Display Terminal is a local control unit which can be mounted on the door of an enclosure with its dedicated door mounting kit (VW3A1112). The Graphic Display Terminal embeds a real-time clock used for the time stamping of logged data and all other functions which require time information.

- 1 STOP / RESET:** Stop command / apply a Fault Reset.
- 2 LOCAL / REMOTE:** used to switch between local and remote control of the drive.
- 3 ESC:** used to quit a menu/parameter or remove the currently displayed value in order to revert to the previous value retained in the memory
- 4 F1 to F4:** function keys used to access drive id, QR code, quick view, and submenus. Simultaneous press of F1 and F4 keys generates a screenshot file in the Graphic Display Terminal internal memory.
- 5 Graphic display.**
- 6 Home:** used to access directly at the home page.
- 7 Information:** used to have more information about menus, submenus, and parameters. The selected parameter or menu code is displayed on the first line of the information page.
- 8 RUN:** executes the function assuming it has been configured.
- 9 Touch wheel / OK:** used to save the current value or access the selected menu/parameter. The touch wheel is used to scroll fast into the menus. Up/down arrows are used for precise selections, right/left arrows are used to select digits when setting a numerical value of a parameter.
- 10 RJ45 Modbus serial port:** used to connect the Graphic Display Terminal to the drive in remote control.
- 11 Mini-B USB port:** used to connect the Graphic Display Terminal to a computer.
- 12 Battery** (10 years service life. Type: CR2032). The battery positive pole points to the front face of the Graphic Display Terminal .

NOTE: Keys 1, 8 and 9 can be used to control the drive if control via the Display Terminal is activated. To activate the keys on the Display Terminal, you first need to set [Ref Freq 1 Config] F_{r1} to [Ref.Freq-Rmt.Term] L_{L1} .

Graphic Display Terminal Connected to a Computer

NOTICE

RISK OF DAMAGE TO THE COMPUTER

Do not connect the Graphic Display Terminal to the drive via a Modbus RJ45 link and to the computer via a USB link at the same time.

Failure to follow these instructions can result in equipment damage.

INDUSTRIAL AUTOMATION

Steps for Setting Up the Drive

Procedure

INSTALLATION

① Receive and inspect the drive controller

- Check that the catalog number printed on the label is the same as that on the purchase order
- Remove the drive from its packaging and check that it has not been damaged

② Verify the supply mains

- Verify that the supply mains is compatible with the power part supply range of the drive.

③ Mount the drive

- Mount the drive in accordance with the instructions in this document
- Install the transformer(s), if any
- Install any internal and external options

④ Wire the drive

- Connect the motor, ensuring that its connections correspond to the voltage
- Connect the supply mains, after making sure that the power is off
- Connect the control

Steps 1 to 4 must be performed with the power off.

⑤ PROGRAMMING

Refer to the Programming Manual

Preliminary Instructions

Verify the Delivery of the Drive

Damaged products or accessories may cause electric shock or unanticipated equipment operation.

DANGER

ELECTRIC SHOCK OR UNANTICIPATED EQUIPMENT OPERATION

Do not use damaged products or accessories.

Failure to follow these instructions will result in death or serious injury.

Contact your local Schneider Electric sales office if you detect any damage whatsoever.

Step	Action
1	Remove the drive from the packaging and verify that it has not been damaged
2	Verify that the catalog number printed on the nameplate corresponds to the purchase order.

Handling and Storage

WARNING

INCORRECT HANDLING

- Follow all handling instructions provided in this manual and in all associated product documentation.
- Handle and store the product in its original packaging.
- Do not handle and store the product if the packaging is damaged or appears to be damaged.
- Take all measures required to avoid damage to the product and other hazards when handling or opening the packaging.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

To help protect the drive before installation, handle and store the device in its packaging. Ensure that the ambient conditions are acceptable.

Handling the Drive

The drives of frame sizes 1, 2 and 3 can be removed from their packaging and installed without a handling device.

The drives of frame sizes 4 and 5 require a handling device; for this reason, these drives include lifting lugs.

About the drawings

All drawings CAD files can be downloaded from www.schneider-electric.com

NOTE:

The dimensions below do not include:

- A depth increase when using the optional plain text display terminal.
- On frame sizes 1, 2 and 3, a 50 mm (2 in.) distance for appropriate front control wiring,
- On frame sizes 4 and 5, a 40 mm (1.58 in) depth increase, if using the additional slot option. This option module takes place between the graphic display terminal and the drive, causing the depth value to be increased. It enables to connect a safety output module, an I/O or relay output module.

Drive Ratings in Heavy Duty

Applications

Altivar Machine variable speed drives are designed for use in two operating modes Heavy duty and Normal duty (*see page 36*). This enables to optimize the drive nominal rating according to the system constraints.

Heavy duty (HD) is a dedicated mode for applications requiring a significant overload (up to 150%) with a motor power identical to the drive nominal power

NOTE:

- For fuse and circuit-breaker ratings refer to the information provided in the Altivar Machine 340 Getting Started Annex (SCCR) [NVE37641](#) for UL/CSA compliance and also in the catalog (*see page 10*) for IEC compliance.
- For motor overload and drive thermal monitoring functions, refer to the ATV340 Programming manual (*see page 10*).

- (1) Drive frame size 4, 5 uses an integrated DC choke, therewith the mains current harmonics and the mains current are reduced.
- (2) The drive is designed for a corresponding line supply. If the Isc is higher a mains choke must be used.
Isc: Short circuit current. See the Annex to the Getting Started ([NVE37641](#)) for UL Short Circuit Current Ratings (SCCR) values.
The products of frame sizes 1, 2 and 3 have no means integrated to reduce the mains current harmonics. The THDi is > 120%. If lower harmonics are required use a mains choke.
- (3) Peak current when power is switched on, for the maximum supply mains voltage.

(1) The switching frequency is adjustable from:

- 2...16 kHz for drive frame sizes 1...3, rated value: 4 kHz
- 2...12 kHz for drive frame size 4, rated value: 4 kHz
- 2...8 kHz for drive frame size 5, rated value: 2.5 kHz

For operation at switching frequencies higher than the rated value. Derating must be applied to the drive (output current (*see page 53*)). In this case, switching frequency can be reduced if an excessive temperature rise occurs.

(2) The drive is designed to run up to 60 s at 150% of nominal current.

(3) The drives of frame sizes 1...3 are designed to run up to 2 s at 180% of nominal current.

INDUSTRIAL AUTOMATION

Drive Ratings in Normal Duty

Applications

Altivar Machine variable speed drives are designed for use in two operating modes Heavy duty (*see page 34*) and Normal duty. This enables to optimize the drive nominal rating according to the system constraints.

Normal duty (ND): Dedicated mode for applications requiring a slight overload (up to 110%) with a motor power one rating higher than the drive nominal power

NOTE:

- For fuse and circuit-breaker ratings refer to the information provided in the Altivar Machine 340 Getting Started Annex (SCCR) [NVE37641](#) for UL/CSA compliance and also in the catalog (*see page 10*) for IEC compliance.
- For motor overload and drive thermal monitoring functions, refer to the ATV340 Programming manual (*see page 10*).

(3) The drives of frame sizes 1...3 are designed to run up to 2 s at 135% of nominal current.

Braking Resistors

General

Braking resistors allow the drives to operate while braking to a standstill or during slowdown braking, by dissipating the braking energy. They enable maximum transient braking torque.

- For a detailed description and catalog numbers, refer to the Catalog (*see page 10*) available on www.schneider-electric.com.
- For mounting instructions, wiring diagrams and other information, refer to the instruction sheet [NHA87388](#) supplied with the resistor and available on www.schneider-electric.com.

Introduction

Overview

DANGER

INSUFFICIENT PROTECTION AGAINST OVERCURRENTS CAN CAUSE FIRE OR EXPLOSION

- Use properly rated overcurrent protection devices.
- Use the fuses/circuit breakers specified.
- Do not connect the product to a supply mains whose prospective short circuit current rating (current that flows during a short circuit) exceeds the specified maximum permissible value.
- When rating the upstream mains fuses and the cross sections as well as the lengths of the mains cables, take into account the minimum required prospective short-circuit current (Isc). Refer to the Upstream Protection Device section.
- If the minimum required prospective short-circuit current (Isc) is not available, apply the instructions given in the section below.

Failure to follow these instructions will result in death or serious injury.

The specified maximum permissible values and products for IEC compliance are specified in the catalog. The specified maximum permissible values and products for UL/CSA compliance are specified in the annex provided with the drive.

General

- The Short Circuit Protective Device (SCPD) rated to the drive will help protect the upstream installation in case of a short-circuit internal to the drive and mitigate the damage to the drive and its surrounding area.
- The SCPD rated to the drive is mandatory to help ensuring the safety of the Power Drive System. It comes in addition to the upstream branch circuit protection which is in compliance with the local regulation for electrical installation.
- The SCPD shall mitigate the damage in case of detected error condition such as an internal short-circuit of the drive.
- The SCPD must take into account both following characteristics...
 - a maximum prospective short-circuit current
 - a minimum required prospective short-circuit current (Isc).

If the minimum required prospective short-circuit current (Isc) is not available, increase the power of the transformer or decrease the length of the cables

In other cases, contact your Schneider Electric Customer Care Center (CCC) www.se.com/CCC for specific selection of Short Circuit Protective Device (SCPD).

Scope

The information below applies to drives fed by a 380...480 Vac mains supply.

Wiring Diagram

This diagram shows an example of installation with both SCPD types, Circuit-breaker (*see page 44*) and Fuse link (*see page 45*) rated to the drive.

INDUSTRIAL AUTOMATION

Prospective Short-Circuit Current

Calculation

The prospective short-circuit current shall be computed at the drive connection points.

We recommend using the Schneider Electric tool Ecodial Advance Calculation available on www.se.com/en/product-range-presentation/61013-ecodial-advance-calculation/

The following equations allow to estimate the value of the symmetrical three-phase prospective short-circuit current (I_{sc}) at the drive connection points.

$$X_t = \frac{U^2}{S_n} \cdot usc$$

$$Z_{cc} = \sqrt{\left(\rho \cdot \frac{l}{S} + R_f\right)^2 + (X_t + X_c \cdot l + X_f)^2}$$

$$I_{sc} = \frac{U}{\sqrt{3}} \cdot \frac{1}{Z_{cc}}$$

- I_{sc}** Symmetrical three-phase prospective short-circuit current (kA)
- X_t** Transformer reactance
- U** No-load phase to phase voltage of the transformer (V)
- S_n** Apparent transformer power (kVA)
- usc** Short-circuit voltage, according to the transformer data sheet (%)
- Z_{cc}** Total short-circuit impedance (mΩ)
- ρ** Conductor resistivity e.g. Cu: 0.01851 mΩ.mm
- l** Conductor length (mm)
- S** Conductor cross section (mm²)
- X_c** Conductor lineic reactance (0.0001 mΩ/mm)
- R_f, X_f** Resistance and reactance of the line filter (mΩ) (*see page 44*)

Additional Line Filter Option

If a line input filter option is required for the installation such as a line reactor or a passive harmonic filter, the minimum prospective short-circuit current capability of the source is reduced at the drive connection point and shall be estimated (see page 42) with the impedance values given in the table below.

Then, the SCPD type shall be selected according to the drive. If no selection is available, Schneider Electric Customer Care Center (CCC) www.se.com/CCC should be contacted.

EMC filter series have no significant effect on the minimum prospective short-circuit current capability of the main source.

Through the line option, the Isc will be limited to a maximum value independent of the transformer and cable. **Therefore the below equations can be used to estimate the minimum prospective short-circuit current capability.**

$$10\text{ m}\Omega \leq X_f \leq 400\text{ m}\Omega \Rightarrow I_{sc_maxi} (kA) = 4.7 - 0.7 \cdot \text{Log}(X_f)$$

$$400\text{ m}\Omega \leq X_f \leq 2000\text{ m}\Omega \Rightarrow I_{sc_maxi} (kA) = 2.05 - 0.26 \cdot \text{Log}(X_f)$$

Log: Natural logarithm

IEC Type Circuit-Breaker as SCPD

Function

The circuit-breaker offers enhanced features versus fuse-link since it cumulates 3 functionalities:

- insulation with lock,
- switch (full load interruption),
- downstream short-circuit protection without replacement.

Selection Table

Schneider Electric circuit-breaker, setting and limits shall be selected according to the following table:

Catalog Number	Circuit-Breaker to IEC 60947-2	Ir m	Minimum Isc

Chapter 3 Drive Mounting

What Is in This Chapter?

This chapter contains the following topics:

Mounting Conditions	48
Derating Curves	53
Mounting Procedures	60

INDUSTRIAL AUTOMATION

Mounting Conditions

Before You Begin

Conductive foreign objects, dust or liquids or damaged parts may cause parasitic voltage.

⚡ ⚠ DANGER
<p>ELECTRIC SHOCK CAUSED BY FOREIGN OBJECTS OR DAMAGE</p> <ul style="list-style-type: none"> Do not use damaged products. Keep foreign objects such as chips, screws or wire clippings from getting into the product. Verify correct seat of seals and cable entries in order to avoid deposits and humidity. <p>Failure to follow these instructions will result in death or serious injury.</p>

The temperature of the products described in this manual may exceed 80 °C (176 °F) during operation.

⚠ WARNING
<p>HOT SURFACES</p> <ul style="list-style-type: none"> Ensure that any contact with hot surfaces is avoided. Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces. Verify that the product has sufficiently cooled down before handling it. Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions. <p>Failure to follow these instructions can result in death, serious injury, or equipment damage.</p>

Power Drive Systems (PDS) can generate strong local electrical and magnetic fields. This can cause interference in electromagnetically sensitive devices.

⚠ WARNING
<p>ELECTROMAGNETIC FIELDS</p> <ul style="list-style-type: none"> Keep persons with electronic medical implants, such as pacemakers, away from the equipment. Do not place electromagnetically sensitive devices in the vicinity of the equipment. <p>Failure to follow these instructions can result in death, serious injury, or equipment damage.</p>

Attach A Label With Safety Instructions

A label kit is provided with the drive. By default the English version of the label is attached to the drive.

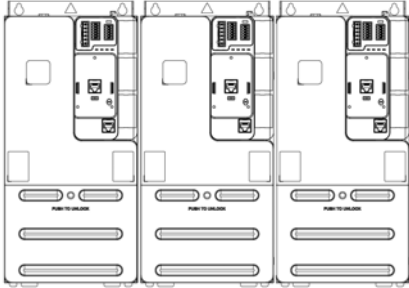

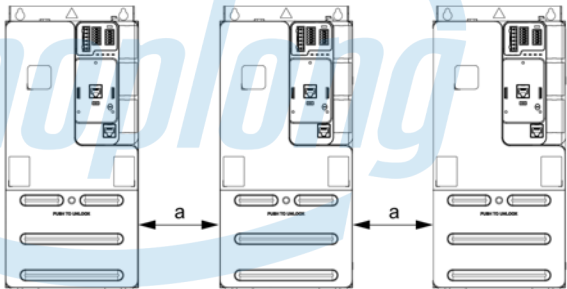

Step	Action
1	Observe the safety regulations in the targeted country
2	Select the label suitable for the targeted country
3	<p>Attach the label to the front of the device so that it is clearly visible. Below is the English version. The label may be different depending on the drive frame size.</p> <div style="text-align: center;">  </div> <p>NOTE: Products used in Canada according to CSA C22.2 no.274 must comply with the requirement defined by the Canadian Advisory council of Electrical Safety (CACES). It defines that dual language (French and English) safety labeling is required on all products for use in Canada. To fulfill this requirement, add the French language safety label on the front panel of the product.</p>

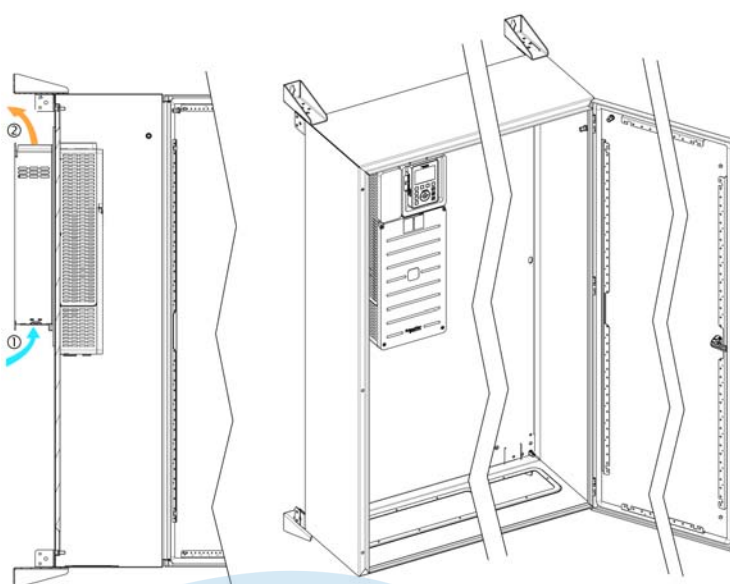

Webserver default Password

If the Nameplate is not visible after the drive mounting phase, note or take a photo of the webserver default password. (see page 18)

Mounting Types

This table shows the possible mounting types and the resulting IP degree of protection.

Clearances and Mounting Position in the Cabinet

Minimum clearance regarding the drive frame size

Frame Size	X1	X2	X3
1, 2 and 3	≥ 100 mm (3.94 in.) (a)	≥ 100 mm (3.94 in.) (a)	≥ 60 mm (2.36 in.) (b)
4 and 5	≥ 100 mm (3.94 in.)	≥ 100 mm (3.94 in.)	≥ 10 mm (0.39 in.) (c)

a Frame sizes 1, 2 and 3 can be fitted with optional EMC kits. These kits could require more free space to cabinet top or bottom
b Frame sizes 1, 2 and 3 use front wiring and allow to plug plain text display terminal.
c Add 33 mm (1.3 in.) when using the optional additional module support VW3A3800 for slot C. Add 47 mm (1.85 in.) when using this option together with the advanced graphic display terminal.

General Mounting Instructions

- Install the drive in a cabinet or in a technical room. No wall mounting installation supported.
- Install drives of frame sizes 1 and 2 on a grounded back plane to improve EMC.
- Mount the drive in a vertical position. This is required for cooling the drive.
- Attach it on the mounting surface in compliance with standards, using the screws with captive washer according to the table given in Mounting Procedures (*see page 60*).
- The use of washers is required with all mounting screws.
- Tighten the fixation screws.
- Do not mount the device close to heat sources.
- Avoid environmental effects like high temperatures and high humidity as well as dust, dirt and conductive gases.
- Adhere to the minimum installation distances for required cooling.
- Do not mount the device on flammable materials.
- Install the drive on a solid, vibration-free support.
- Maintain all wiring on backplates or by using existing EMC kits to avoid stress on connectors.
- For frame sizes 1, 2 and 3, use only the connectors supplied with the product for wiring. Connector kits are also available, refer to the catalog on www.schneider-electric.com

Derating Curves

Description

Derating curves for the nominal drive current (I_n) as a function of temperature and switching frequency. Refer to the Mounting Conditions chapter (*see page 48*) for the mounting types description.

Frame Size 1 - 0.7 kW

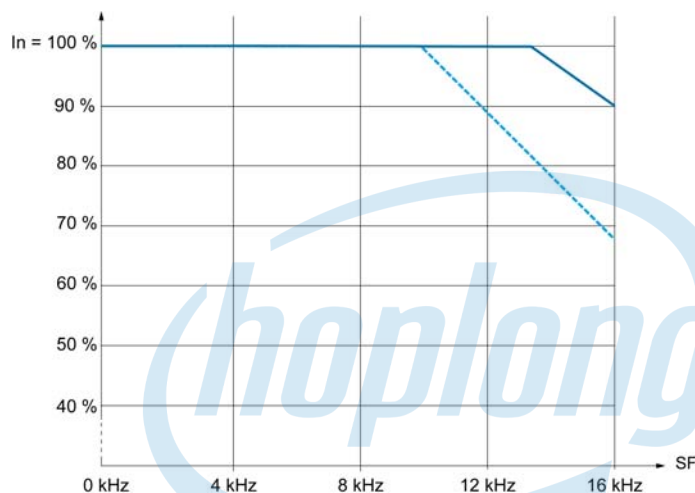

No derating required.

NOTE:

For 60°C operation:

- Type B mounting required
- No plain text display terminal plugged

Frame Size 1 - 1.5 kW

— 40 °C (104 °F) - Mounting type A

- - - 50 °C (122 °F) - Mounting type A

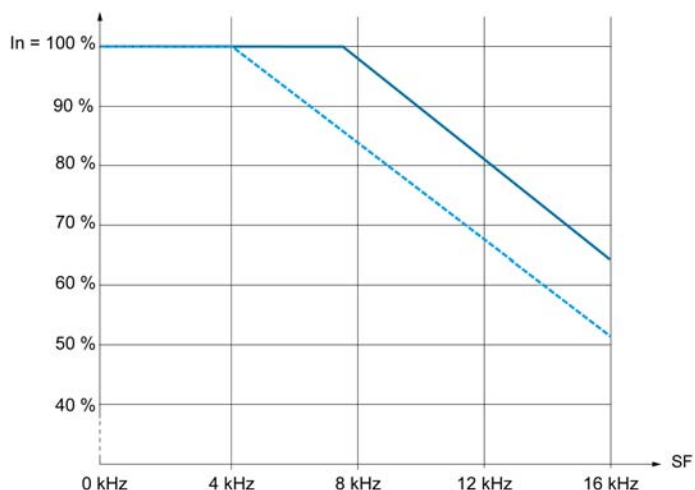

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- Type B mounting required
- No plain text display terminal plugged
- No current derating needed

Frame Size 1 - 2.2 kW

— 40 °C (104 °F) - Mounting type A

- - - 50 °C (122 °F) - Mounting type A

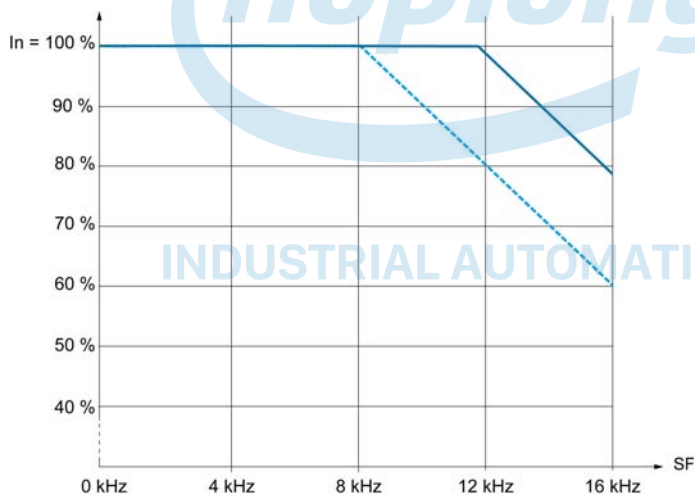

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- Type B mounting required
- No plain text display terminal plugged
- No current derating needed

Frame Size 1 - 3 kW

— 40 °C (104 °F) - Mounting type A

- - - 50 °C (122 °F) - Mounting type A

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- Type B mounting required
- No plain text display terminal plugged
- No current derating needed

Frame Size 1 - 4 kW

— 40 °C (104 °F) - Mounting type A
 - - - 50 °C (122 °F) - Mounting type A

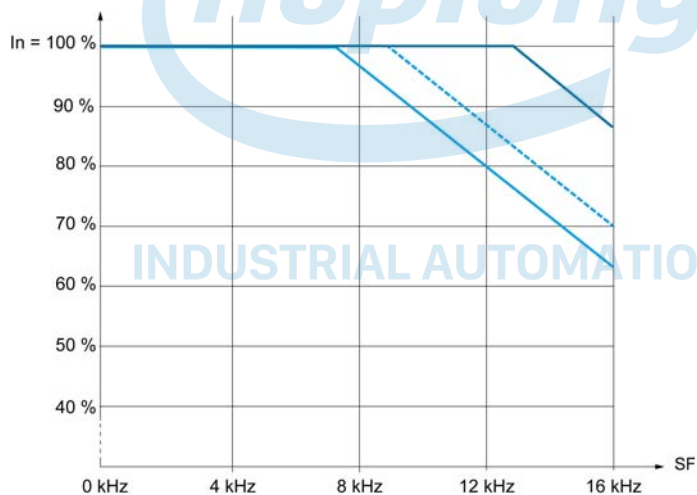

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- Type B mounting required
- No plain text display terminal plugged
- No current derating needed

Frame Size 2 - 5.5 kW

— 40 °C (104 °F) - Mounting type A and B
 - - - 50 °C (122 °F) - Mounting type A and B
 — 60 °C (140 °F) - Mounting type B

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- No side-by-side mounting
- No plain text display terminal plugged

Frame Size 2 - 7.5 kW

- 40 °C (104 °F) - Mounting type A and B
- ... 50 °C (122 °F) - Mounting type A and B
- 60 °C (140 °F) - Mounting type B

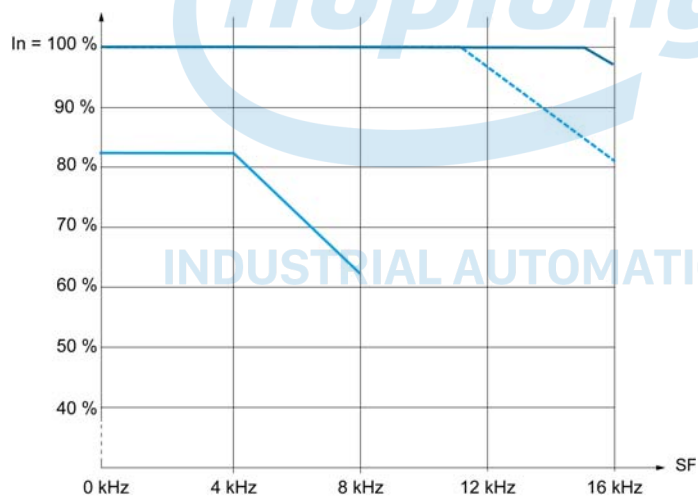

In Normal duty, these curves are also valid for a temperature 10°C less than the given temperatures.

NOTE:

For 60°C operation:

- No side-by-side mounting
- No plain text display terminal plugged

Frame Size 3 - 11 kW

- 40 °C (104 °F) - Mounting type A and B

Mounting Procedures

Mounting Screws

Frame Size	Screw diameter
1	5 mm (0.2 in)
2	5 mm (0.2 in)
3	5 mm (0.2 in)
4	6 mm (0.24 in)
5	8 mm (0.3 in)

NOTE:

- Fixation by screws is required for all drives ratings.
- Screws are not delivered with the product.

Mounting Procedure For Frame Sizes 1 to 3

Mounting the drive does not require preliminary dismantling operation. Simply mount the drive to its support using the 4 screws with captive washer, according to the table above.

Mount the drive on a metallic backplane for EMC requirements.

Mounting Procedure For Frame Sizes 4 and 5

Perform the following instructions

Step	Action
1	Unscrew the 6 screws (frame size 4) or the 8 screws (frame size 5) attaching the front and bottom covers
2	Remove the covers
3	Attach the drive on the mounting surface using the screws with captive washer, according to the table above (see page 60).

INDUSTRIAL AUTOMATION

Wiring Instructions

General Instructions

The entire installation procedure must be performed without voltage present.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Read and understand the instructions in **Safety Information** chapter before performing any procedure in this chapter.

Failure to follow these instructions will result in death or serious injury.

Drive systems may perform unexpected movements because of incorrect wiring, incorrect settings, incorrect data or other errors.

WARNING

UNANTICIPATED EQUIPMENT OPERATION

- Carefully install the wiring in accordance with the EMC requirements.
- Do not operate the product with unknown or unsuitable settings or data.
- Perform a comprehensive commissioning test.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Unsuitable settings or unsuitable data or unsuitable wiring may trigger unintended movements, trigger signals, damage parts and disable monitoring functions.

WARNING

UNANTICIPATED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation.
- Do not operate the drive system with unknown settings or data.
- Verify that the wiring is appropriate for the settings.
- Never modify a parameter unless you fully understand the parameter and all effects of the modification.
- When commissioning, carefully run tests for all operating states, operating conditions and potential error situations.
- Anticipate movements in unintended directions or oscillation of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

DANGER

HAZARD OF FIRE OR ELECTRIC SHOCK

- Wire cross sections and tightening torques must comply with the specifications provided in this document
- If you use flexible multi-wire cables for a connection with a voltage higher than 25 Vac, you must use ring type cable lugs or wire ferrules, depending on the connection.

Failure to follow these instructions will result in death or serious injury.

The product has a leakage current greater than 3.5 mA. If the protective ground connection is interrupted, a hazardous touch current may flow if the product is touched.

⚡ ⚠ DANGER

ELECTRIC SHOCK CAUSED BY HIGH LEAKAGE CURRENT

- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.

Failure to follow these instructions will result in death or serious injury.

⚡ ⚠ DANGER

INSUFFICIENT PROTECTION AGAINST OVERCURRENTS CAN CAUSE FIRE OR EXPLOSION

- Use properly rated overcurrent protection devices.
- Use the fuses/circuit breakers specified.
- Do not connect the product to a supply mains whose prospective short circuit current rating (current that flows during a short circuit) exceeds the specified maximum permissible value.
- When rating the upstream mains fuses and the cross sections as well as the lengths of the mains cables, take into account the minimum required prospective short-circuit current (I_{sc}). Refer to the Upstream Protection Device section.
- If the minimum required prospective short-circuit current (I_{sc}) is not available, apply the instructions given in the section below.

Failure to follow these instructions will result in death or serious injury.

The specified maximum permissible values and products for IEC compliance are specified in the catalog.

The specified maximum permissible values and products for UL/CSA compliance are specified in the annex provided with the drive.

- Ensure that the resistance to ground is < 100 mOhm.
- Use correct wire cross section for grounding.
- When grounding several drives, you must connect each one directly, as shown in the figure below.
- Do not loop ground cables or connect them in series.

Residual Current Device

Direct current can be introduced in the protective ground conductor of this drive. If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for additional protection against direct or indirect contact, the following specific types must be used.

WARNING

DIRECT CURRENT CAN BE INTRODUCED INTO THE PROTECTIVE GROUND CONDUCTOR

- Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for single-phase drives connected to a phase and to the neutral conductor.
- Use a Type B Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) that has approval for use with frequency inverters and is sensitive to all types of current for three-phase devices and for single-phase devices not connected to a phase and the neutral conductor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Further conditions for use of a residual current device:

- The drive has an increased leakage current at the moment power is applied. Use a residual current device (RCD / GFCI) or a residual current monitor (RCM) with a response delay.
- High-frequency currents must be filtered.

Choose a suitable model integrating:

- High frequency current filtering
- A time delay that helps to prevent a triggering of the upstream device caused by the load from stray capacitance on power-on. The time delay is not available for 30 mA device; in this case, choose devices with immunity against nuisance triggering.

Due to high leakage current in standard operation, we recommend choosing at least a 300 mA device.

If the installation requires a residual current device less than 300 mA, it can be possible to use a device lower than 300 mA by changing the IT switch position (drive sizes 1...3) or by removing the screws (drive sizes 4 and 5) according to the instructions given in the **Operation on an IT System** section (*see page 77*).

If the installation includes several drives, provide one residual current device per drive.

Equipment Grounding

NOTICE

DESTRUCTION DUE TO INCORRECT WIRING

- Before switching on and configuring the product, verify that it is properly wired.

Failure to follow these instructions can result in equipment damage.

DANGER

ELECTRIC SHOCK CAUSED BY INSUFFICIENT GROUNDING

- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- The cross section of the protective ground conductor must comply with the applicable standards.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not consider cable shields to be protective ground conductors.

Failure to follow these instructions will result in death or serious injury.

Tighten the grounding screws according to the instructions given in the Ground Cables section (*see page 88*).

Before Wiring The Frame Sizes 1...3

The packaging of these drives includes covers to be cut off and placed over the top side of the drive before wiring operations. These covers help to avoid foreign conductive parts or liquids to fall into the drive.

The example shown below is for frame size 3

Perform the following instructions to mount the covers

Step	Action
1	Cut the covers from the packaging
2	Cut and discard the cutouts
3	Fit the covers on the drive
4	Install the drive
5	Remove top covers for normal operation

Cable Characteristics

Only use cables with insulator heat resistance of 75°C (167°F) min.

If you are using cables longer than 150 m (492 ft) between the drive and the motor, add output filters (for more details refer to the catalog).

Use a shielded cable to meet the requirements of Category C2 or C3 according to the standard IEC 61800-3, except when using a sinus filter. In this case, the use of a non-shielded motor cable is possible.

To limit the currents in common mode, use common mode output filters (ferrite) in order to reduce the circulating currents in the motor windings.

Standard linear capacity cables can be used. Use of cables with lower linear capacity could increase cable length performances.

The overvoltage limitation function [**Motor surge limit.**] $5 V L$ enables you to increase the cable length while decreasing the torque performances (refer to Programming manual). (see page 10)

Cable Length Instructions

Long Cable Lengths Consequences

NOTE: Maximum cable length is 100 m (328 ft).

When drives are used with motors, a combination of fast switching transistors and long motor cables can even cause peak voltages up to twice the DC link voltage. This high peak voltage can cause premature aging of motor winding insulation which leads to motor breakdown.

The overvoltage limitation function will enable to increase the cable length while decreasing the torque performances.

Length Of Motor Cables

Because of the permitted mains disturbances, the allowed overvoltages at the motor, the occurring bearing currents and the permitted heat losses the distance between inverter and motor(s) is limited.

The maximum distance heavily depends on the used motors (insulation material), the type of motor cable used (shielded/unshielded), as well as the cable laying (cable channel, underground installation...).

Dynamic Voltage Load Of The Motor

Overvoltages at the motor terminals result from reflection in the motor cable. Basically the motors are stressed with measurable higher voltage peaks from a motor cable length of 10 m. With the length of the motor cable also the value of overvoltage increases.

The steep edges of the switching impulses at the output side of the frequency inverter lead to a further load of the motors. The slew rate of the voltage is typically over 5 kV/μs but it decreases with the length of the motor cable

Use a shielded cable to meet the requirements of Category C2 or C3 according to the standard IEC 61800-3.

Standard linear capacity cables can be used with Altivar Machine. Use of cables with lower linear capacity could increase cable length performances.

To reduce the voltage stress on the motor windings an overvoltage limitation function **[Motor surge limit.]** $5 \mu L$ can be activated when using long motor cables, within the maximum cable length of 100 m (328 ft), while decreasing the torque performances (refer to Programming manual [NVE61643](#)).

Corrective Actions Overview

A number of simple measures can be taken to help enhance the motor life time:

- Specification of a motor designed for speed drive applications (IEC60034-25 B or NEMA 400 should be prescribed).
- Reduce to a minimum the distance between motor and drive.
- Use unshielded cables.
NOTE: EMC performance not guaranteed with unshielded cables
- Reduce the drive switching frequency (a reduction to 2.5 kHz is recommended.)

Electromagnetic Compatibility

Limit Values

This product meets the EMC requirements according to the standard IEC 61800-3 if the measures described in this manual are implemented during installation.

This product meets the EMC requirements according to the standard IEC 61800-3. If the selected composition (product itself, mains filter, other accessories and measures) does not meet the requirements of category C1, the following information applies as it appears in IEC 61800-3:

 WARNING
<p>RADIO INTERFERENCE</p> <p>In a domestic environment this product may cause radio interference in which case supplementary mitigation measures may be required.</p> <p>Failure to follow these instructions can result in death, serious injury, or equipment damage.</p>

EMC requirements for the control cabinet

EMC measures	Objective
Use mounting plates with good electrical conductivity, connect large surface areas of metal parts, remove paint from contact areas.	Good conductivity due to large surface contact.
Ground the control cabinet, the control cabinet door and the mounting plate with ground straps or ground wires. The conductor cross section must be at least 10 mm ² (AWG 8).	Reduces emissions.
Fit switching devices such as power contactors, relays or solenoid valves with interference suppression units or arc suppressors (for example, diodes, varistors, RC circuits).	Reduces mutual interference.
Install power components and control components separately.	
Install frame size 1 and 2 drives on grounded metal back plane.	Reduces emissions.

Shielded cables

EMC measures	Objective
Connect large surface areas of cable shields, use cable clamps and ground straps.	Reduces emissions.
Use cable clamps to connect a large surface area of the shields of all shielded cables to the mounting plate at the control cabinet entry.	
Ground shields of digital signal wires (<i>see page 70</i>) at both ends by connecting them to a large surface area or via conductive connector housings	Reduces interference affecting the signal wires, reduces emissions
Ground the shields of analog signal wires directly at the device (signal input); insulate the shield at the other cable end or ground it via a capacitor (for example, 10 nF, 100 V or higher).	Reduces ground loops due to low-frequency interference.
Use only shielded motor cables with copper braid and a coverage of at least 85%, ground a large surface area of the shield at both ends.	Diverts interference currents in a controlled way, reduces emissions.

Cable Installation

EMC measures	Objective
Do not route fieldbus cables and signal wires in a single cable duct together with lines with DC and AC voltages of more than 60 V. (Fieldbus cables, signal lines and analog lines may be in the same cable duct) Recommendation: Use separate cable ducts at least 20 cm apart.	Reduces mutual interference.
Keep cables as short as possible. Do not install unnecessary cable loops, use short cables from the central grounding point in the control cabinet to the external ground connection.	Reduces capacitive and inductive interference.
Use equipotential bonding conductors in the following cases: wide-area installations, different voltage supplies and installation across several buildings.	Reduces current in the cable shield, reduces emissions.
Use fine stranded equipotential bonding conductors.	Diverts high-frequency interference currents
If motor and machine are not conductively connected, for example by an insulated flange or a connection without surface contact, you must ground the motor with a ground strap or a ground wire. The conductor cross section must be at least 10 mm ² (AWG 6).	Reduces emissions, increases immunity.
Use twisted pair for the DC supply. For digital and analog inputs use shielded twisted cables with a pitch of between 25...50 mm (1...2 in).	Reduces interference affecting the signal cables, reduces emissions.

Power Supply

EMC measures	Objective
Operate product on mains with grounded neutral point.	Enables effectiveness of mains filter.
Surge arrester if there is a risk of overvoltage.	Reduces the risk of damage caused by overvoltage.

Additional measures for EMC improvement

Depending on the application, the following measures can improve the EMC-dependent values:

EMC measures	Objective
Use mains chokes	Reduces mains harmonics, prolongs product service life.
Use external mains filters	Improves the EMC limit values.
Additional EMC measures, for example mounting in a closed control cabinet with 15 dB shielding attenuation of radiated interference	

NOTE: If using an additional input filter, it should be mounted side by side to the drive and connected directly to the supply mains via an unshielded cable.

If a Run command is executed while the downstream contactor between the drive and the motor is still open, there may be residual voltage at the output of the drive. This can cause an incorrect estimation of the motor speed when the contacts of the downstream contactor are closed. This incorrect estimation of the motor speed can lead to unanticipated equipment operation or to equipment damage.

In addition, there may be overvoltage at the output of the drive if the power stage is still enabled when the downstream contactor between the drive and the motor opens.

⚠ WARNING

UNANTICIPATED EQUIPMENT OPERATION OR EQUIPMENT DAMAGE

If a downstream contactor is used between the drive and the motor, verify the following:

- The contacts between the motor and the drive must be closed before a Run command is executed.
- The power stage must not be enabled when the contacts between the motor and the drive open.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Operation on an IT System

Definition

IT system: Isolated or impedance grounded neutral. Use a permanent insulation monitoring device compatible with nonlinear loads, such as an XM200 type or equivalent.

Operation

<i>NOTICE</i>
OVERVOLTAGE OR OVERHEATING If the drive is operated via an IT or corner grounded system, the integrated EMC filter must be disconnected as described in the present manual. Failure to follow these instructions can result in equipment damage.

⚡ ⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Read and understand the instructions in **Safety Information** chapter before performing any procedure in this chapter.

Failure to follow these instructions will result in death or serious injury.

The drives have a built-in EMC filter. As a result they exhibit leakage current to ground. If the leakage current creates compatibility problems with your installation (residual current device or other), then you can reduce the leakage current by deactivating the Y capacitors as shown below. In this configuration the product does not meet the EMC requirements according to the standard IEC 61800-3.

Setting on Frame Sizes 1 and 2

Apply the following instructions to disconnect the built-in EMC filter

Step	Action
1	The switch is factory set to the  position as shown on detail ①
2	To disconnect the built-in EMC filter  use a screwdriver to set the switch to the position shown on detail ②

Setting on Frame Size 3

Apply the following instructions to disconnect the built-in EMC filter

Step	Action
1	Remove the front cover.
2	The switch is factory set to the  position as shown on detail ①
3	To disconnect the built-in EMC filter  use a screwdriver to set the switch to the position shown on detail ②
4	Refit the front cover.

Setting on Frame Sizes 4 and 5

Apply the following instructions to disconnect the built-in EMC filter

Step	Action
1	Remove the front cover (see page 86)
2	The screw is factory set to the  position as shown on detail ①
3	To disconnect the built-in EMC filter, remove the screw from its location and set it to the  position as shown on detail ②
4	Refit the front cover

NOTE:

- Use only the screws supplied.
- Do not operate the drive with setting screws removed.

Arrangement and Characteristics of Control Block Terminals, Communication and I/O Ports

Front Control Terminals - Drive Frame Sizes 1...3

Connector / Switch	Description
GP-SF	Slot for safety and general purpose modules like I/O, Relay
GP-ENC	Slot for encoder module. Use only VW3A3420 , VW3A3422 , VW3A3423 modules and general purpose modules like I/O, Relay
HMI	RJ45 port for Plain Text Display Terminal (VW3A1113) direct plug-in or Graphic Display Terminal (VW3A1111) to connect with a cable (<i>see page 20</i>)
ETH1, ETH2	2 x RJ45 Advanced Ethernet ports, on ATV340... E
S3 P1, S3 P2	2 x RJ45 Embedded Sercos III ports, on ATV340... S
GP-FB	Slot for fieldbus and general purpose modules like IO, Relay
CN7	Modbus VP12S port (<i>see page 107</i>)
SK/EXT/SRC switch	Sink-Source switch (<i>see page 123</i>)
CN6	Analog and digital I/O, relay outputs... (<i>see page 104</i>)

Top Control Terminals Location on Drive Frame Sizes 1...3

Connector / Switch	Description
CN3 ENC	Embedded encoder (<i>see page 99</i>) NOTE: An additional clearance is required on top of the drive when using the embedded encoder.
CN4	PTO (Pulse Train Output) (<i>see page 101</i>)
CN5	PTI (Pulse Train Input) (<i>see page 101</i>)
CN2/STO 24Vdc	STO (Safe Torque Off) (<i>see page 98</i>)

Control Block Ports

Legend

Marking	Description
①	Drive status LEDs (<i>see page 120</i>)
②	RJ45 port to plug directly a plain text display terminal or using a cable to connect a Graphic display terminal
③	2 x RJ45 ports: ETH1 and ETH2 for Ethernet embedded
④	SK-EXT-SRC switch SW1 (<i>see page 123</i>) PTO-DQ switch SW2 (<i>see page 126</i>)
⑤	RJ45 port for Modbus embedded
⑥	Slot B, for encoder interface, and GP (general purpose) modules like I/O, Relay...
⑦	Slot A, for fieldbus communication and GP (general purpose) modules like I/O, Relay...

Optional Module Installation and Wiring

NOTE:

- For possible fieldbus module list, refer to the catalog (*see page 10*)
- For fieldbus modules information, refer to the instruction sheet [S1A45591](#) available on www.schneider-electric.com

RJ45 Communication ports

The control block includes 4 RJ45 ports.

They allow to connect a:

- PC
 - Using a commissioning software (SoMove, SoMachine...), to configure and monitor the drive
 - To access the drive webserver
- SCADA system
- PLC system
- Graphic Display terminal, using Modbus protocol
- Modbus fieldbus

Connection is also possible using optional:

- Bluetooth
- Wi-Fi dongle
- USB/Modbus converter

NOTE:

- Verify that RJ45 cable is not damaged prior to connect it to the product otherwise the power supply of the control could be lost.
- Do not plug Ethernet or Sercos III cable in Modbus plug or vice versa.
- Do not plug PTI, PTO interface cable to Ethernet, Sercos III or Modbus plugs or vice versa.
- Use different cable colors for Ethernet, Sercos III, Modbus, PTI or PTO to facilitate Fast Device Replacing operations.
- Verify the correct wiring of the drive before to switch the system on.

Preliminary Steps

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Read and understand the instructions in **Safety Information** chapter before performing any procedure in this chapter.

Failure to follow these instructions will result in death or serious injury.

Unsuitable settings or unsuitable data or unsuitable wiring may trigger unintended movements, trigger signals, damage parts and disable monitoring functions.

WARNING

UNANTICIPATED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation.
- Do not operate the drive system with unknown settings or data.
- Verify that the wiring is appropriate for the settings.
- Never modify a parameter unless you fully understand the parameter and all effects of the modification.
- When commissioning, carefully run tests for all operating states, operating conditions and potential error situations.
- Anticipate movements in unintended directions or oscillation of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

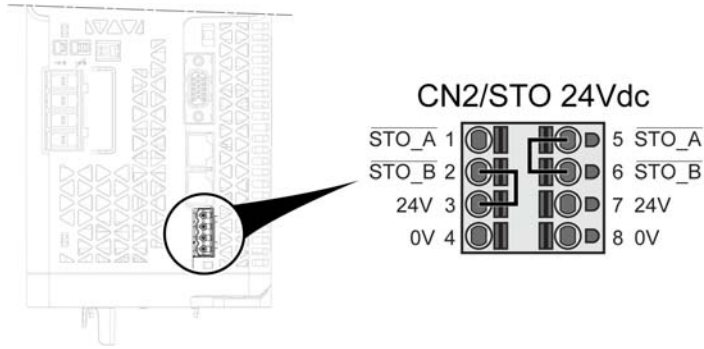

General

This section provides technical data relating to control terminals on frame sizes 1...3. The control terminals electrical data are different for frame sizes 1,2,3 and frame sizes 4 and 5 (*see page 108*).

NOTE:

- For a description of the terminal arrangement, refer to Arrangement and Characteristics of Control Terminals and Communication And I/O Ports (*see page 93*)
- For factory setting I/O assignment, refer to the Programming manual (*see page 10*) available on www.schneider-electric.com.
- For all LEDs description, refer to the Product LEDs section (*see page 120*) or to the Programming manual (*see page 10*) available on www.schneider-electric.com.

Special Features:

- Wire break detection on DATA_A and DATA_B channel
- Safety: SIL1 (SC SIL2)

NOTE:

- Cable connector needs to be screwed to CN3 Encoder interface and cable must be maintained on cabinet backplane and drive top
- If you add an option module, verify the wiring diagram which is different between the CN3 connector and the Analog Encoder module ([VW3A3422](#)), or the Digital Encoder module ([VW3A3420](#)).

Cable connection tips:

- Before connecting the encoder cable check carefully the wiring against above signal table and ensure that there are no short circuits between signals
- For 24V encoder supply activation see the parameter **[24 V Supply Output] 5 2 4 V** described in the Programming manual (*see page 10*) available on www.schneider-electric.com
- For good EMC performance and connection reliability under vibration ensure proper assembly of encoder connector to CN3 interface by UNC screw fixing
- Encoder cable needs to be maintained on top of drive (use cable tie fixation on plastic fin) or cabinet backplane for strain relief

Maximum cable length according to encoder supply:

- 12 Vdc / 24 Vdc: 100 m (328 ft)
- 5 Vdc: 10 m (32 ft)

Recommended encoder cable:

- Encoder cable 100 m (328 ft), ends open, catalog number [VW3M8221R1000](#)
 - 1 x 2 x 0.5 mm² (AWG20) for supply line
 - 5 x 2 x 0.25 mm² (AWG26) for signal and sensor lines

Drive Frame Sizes 1...3 - Front Side HMI and CN7 RJ45 Modbus Connectors

HMI: It is intended to connect the optional plain text display terminal or graphic display terminal.

- Plain text display terminal ([VW3A1113](#)): can be either plugged on the drive or mounted on the door of an enclosure with its dedicated door mounting kit (VW3A1114).
- Graphic display terminal ([VW3A1111](#)): cannot be plugged directly on the drive. It can be connected to the HMI port using a cable or it can be mounted on the door of an enclosure with its dedicated door mounting kit ([VW3A1112](#))

CN7: RJ45 Modbus VP12S port reserved for modbus fieldbus and commissioning tool.

Control Terminals Electrical data for Frame Sizes 4 and 5

General

This section provides technical data relating to control terminals for frame sizes 4, 5. The control terminals electrical data are different for frame sizes 1,2,3 and frame sizes 4, 5

NOTE:

- For a description of the terminal arrangement, refer to Arrangement and Characteristics of Control Terminals and Communication And I/O Ports (*see page 93*)
- For factory setting I/O assignment, refer to the Programming manual (*see page 10*) available on www.schneider-electric.com.
- For all LEDs description, refer to the Product LEDs section (*see page 120*) or to the Programming manual (*see page 10*) available on www.schneider-electric.com.

Characteristics of Control Terminals

NOTE:

- For a description of the terminal arrangement, refer to Arrangement and Characteristics of Control Terminals and Communication And I/O Ports (*see page 93*).
- For factory setting I/O assignment, refer to the Programming manual (*see page 10*).

INDUSTRIAL AUTOMATION

Wiring The Control Part of Frame Sizes 4 and 5

Preliminary Steps

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Read and understand the instructions in **Safety Information** chapter before performing any procedure in this chapter.

Failure to follow these instructions will result in death or serious injury.

Unsuitable settings or unsuitable data or unsuitable wiring may trigger unintended movements, trigger signals, damage parts and disable monitoring functions.

WARNING

UNANTICIPATED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation.
- Do not operate the drive system with unknown settings or data.
- Verify that the wiring is appropriate for the settings.
- Never modify a parameter unless you fully understand the parameter and all effects of the modification.
- When commissioning, carefully run tests for all operating states, operating conditions and potential error situations.
- Anticipate movements in unintended directions or oscillation of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

INDUSTRIAL AUTOMATION

I/O Relay Module Installation and Wiring

NOTE:

- For possible fieldbus module list, refer to the catalog (*see page 10*).
- For fieldbus modules information, refer to the instruction sheet [S1A45591](#) available on www.se.com

To help ensure correct wiring of the control part, apply the following instructions to install and connect an I/O relay module.

Step	Action
1	Insert the I/O relay module in an option slot.
2	Push the module into its location and keep access to the module terminal screws.
3	Insert the I/O cable in the cabling plate, according to the outlined location.
4	Wire the I/O relay module.
5	Push again the module to its final position.

Encoder Interface Module Installation and Wiring

To help ensure correct wiring of the control part, apply the following instructions to install the encoder interface module

Step	Action
1	Insert the encoder interface module in the slot B (see page 96) and push it to its final position until you hear a “click” sound
2	Insert the cable in the cabling plate, according to the outlined location.
3	Wire the SUB-D connector
4	Plug the SUB-D connector on the option module

Shielding The Encoder Cable

Perform the wiring of the optional digital encoder interface module as described on the figure below to help improve EMC performance.

INDUSTRIAL AUTOMATION

Optional Module Installation and Wiring

To help ensure correct wiring of the control part, apply the following instructions to install and connect a module to be wired

Step	Action
1	Insert the module in the slot A or B (<i>see page 96</i>).
2	Insert the cable in the cabling plate, according to the outlined locations. The breakable cut out is used for fieldbus cables.
3	Connect the cable to the module

I/O Relay Module Installation and Wiring

To help ensure correct wiring of the control part, apply the following instructions to install an I/O relay module

Step	Action
1	Insert the I/O relay module in an option slot
2	Push the module into its location and keep access to the module terminal screws
3	Insert the I/O cable in the cabling plate, according to the outlined location
4	Wire the I/O relay module
5	Push again the module to its final position.

Control Block Wiring

To help ensure correct wiring of the control part, apply the following instructions to wire the control block terminals

Step	Action
1	Wire the P24, 0V, the digital inputs (DI1...DI8), the 24V and DQ+ terminals
2	Wire the safety outputs STOA, STOB, the 24V, the 10V, the analog inputs (AI1...AI3), the COM, the analog outputs (AQ1...AQ2), the COM and DQ- terminals
3	Wire the Relay outputs

Product LEDs

Introduction

The drive embeds status LEDs that are used to indicate the drive status.

The number of LEDs available varies according to the drive.

- For frame sizes 1...3 - ATV340U07N4...ATV340D22N4: 4 LEDs.
- For frame sizes 1...3 - ATV340U07N4E...ATV340D22N4E: 4 additional LEDs on ETH1 and ETH2 ports
- For frame sizes 4 and 5 - ATV340D30N4E to ATV340D75N4E: 10 LEDs.

LEDs Description for Frame Sizes 1...3 - ATV340U07N4 to ATV340D22N4

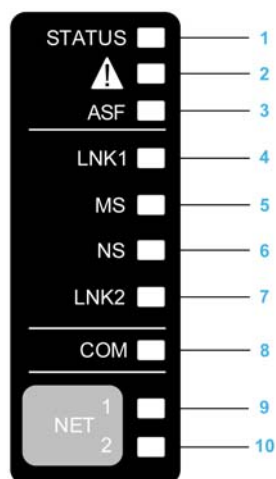

Following table provides the details of the drive status LEDs:

Item	LED	Color & status	Description
1	STATUS	OFF	Indicates that the drive is powered off
		Green flashing	Indicates that the drive is not running, ready to start
		Green blinking	Indicates that the drive is in transitory status (acceleration, deceleration, and so on)
		Green on	Indicates that the drive is running
		Yellow on	Device visual identification when using the DTM based commissioning software
2	Warning/Error	Red flashing	Indicates that the drive has detected a warning
		Red on	Indicates that the drive has detected an error
3	ASF	Yellow on	Indicates that the safety function has been triggered
4	COM	Yellow flashing	Indicates embedded Modbus serial activity

⚠ WARNING

UNANTICIPATED EQUIPMENT OPERATION

- If the drive is set to **SK** or **EXT**, do not connect the **0 V** terminal to ground or to protective ground.
- Verify that accidental grounding of digital inputs configured for sink logic, caused, for example, by damage to the signal cables, cannot occur.
- Follow all applicable standards and directives such as NFPA 79 and EN 60204 for proper control circuit grounding practices.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Switch Description

The switch markings correspond to the following:

Marking	Description
SK	Sink internal
EXT	Sink external
SRC	Source

The switch is used to adapt the operation of the digital inputs to the technology of the programmable controller outputs. The switch is located below the HMI port. It has only an influence on DIx and DQx used in digital input mode.

Settings

Switch Position	Description	Power Supply
	Source Set the switch to SRC Source (factory setting) if using PLC outputs with PNP transistors. Positive Logic PLC. Outputs switches to +24V when active. Common to Europe PLCs.	DISUP: 24 Vdc Can be used to supply 24 Vdc to switches.
	External (sink) Switch Set to EXT (Sink external) position and use of an External Power Supply	DISUP: To be connected to 24 Vdc to supply all DIx internal logic
	Sink Set the switch to SK (Sink internal) if using PLC outputs with NPN transistors. Negative Logic PLC, Outputs switches to 0 V when active. Common to Asian PLCs.	DISUP: 0V Can be used to supply 0V to switches

All details related to the STO safety function activation are given in the Embedded Safety Function Manual [NVE64143](#).

When not used for functional safety the STO inputs should be connected to 24V.

NOTE:

- On frame sizes 1, 2 and 3, the 24 V (pin 3) can be disabled using **[24V Supply Output] 5 2 4 V** menu. If the 24 V Supply output is disabled the STO signals must be externally supplied. Refer to the programming manual [NVE61643](#)
- To avoid triggering the STO function when switching-on the product, the external power supply must be previously switched on.

NOTE:

- On frame sizes 4 and 5, STO inputs are also connected by default on a 24 Vdc terminal. If the external power supply is switched off, the function STO will be triggered.
- To avoid triggering the STO function when switching-on the product, the external power supply must be previously switched on.

⚠ WARNING

UNANTICIPATED EQUIPMENT OPERATION

- If the drive is set to **SK** or **EXT**, do not connect the **0 V** terminal to ground or to protective ground.
- Verify that accidental grounding of digital inputs configured for sink logic, caused, for example, by damage to the signal cables, cannot occur.
- Follow all applicable standards and directives such as NFPA 79 and EN 60204 for proper control circuit grounding practices.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Digital Inputs: Internal Supply Using DISUP Signal

Switch can be set either to SK or SRC position. SRC setting recommended. In SRC position DISUP outputs 24 V. In SK position DISUP is connected to 0 V.

Digital Inputs: Positive Logic, Source, European Style, External Supply

Set the switch to SRC position.

Digital Inputs: Negative Logic, Sink, Asian Style, External Supply

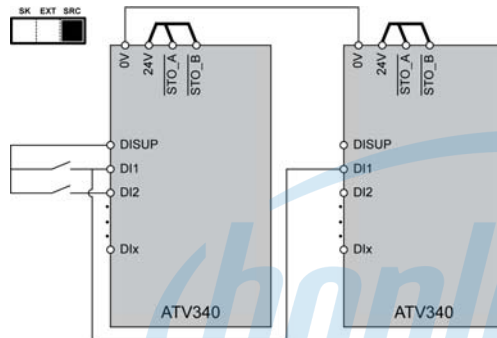

Set the switch to EXT position.

Digital Inputs: Negative Logic, Sink, Asian Style, Internal supply

Set the switch to SK position.

Digital Inputs: Two ATV340 Share The Same Switch

SRC setting recommended on both ATV340. With SK setting, an active switch will be detected when the second drive is switched-off.

Digital Inputs: Negative Logic, Sink, Asian Style, Internal Supply - Two ATV340 Share The Same Switch

Set the switch to SK position on first drive. Set the switch to EXT position on the second drive. Connect DISUP to 24V. Connect 0V.

DQ1 and DQ2 settings

The following table shows the possible settings. Refer to the CN6 connector terminal description ([see page 104](#)), the control block wiring diagram ([see page 71](#)), and the programming manual ([see page 10](#)).

If...	Then...
DQ1 and DQ2 are not configured (factory setting)	DQ1 and DQ2 are digital outputs
DQ1 and DQ2 are configured as digital inputs	DQ1 and DQ2 become digital inputs DI6 (DQ1) and DI7 (DQ2)

NOTE:

- Hardware wiring and software settings must be consistent,
- It is not possible to set DQ1 and DQ2 to get digital input and digital output at the same time.

Section 4.11

Relay Contacts Wiring

What Is in This Section?

This section contains the following topics:

Topic	Page
Output Relay with Inductive AC Loads	140
Output Relay with Inductive DC loads	141

INDUSTRIAL AUTOMATION

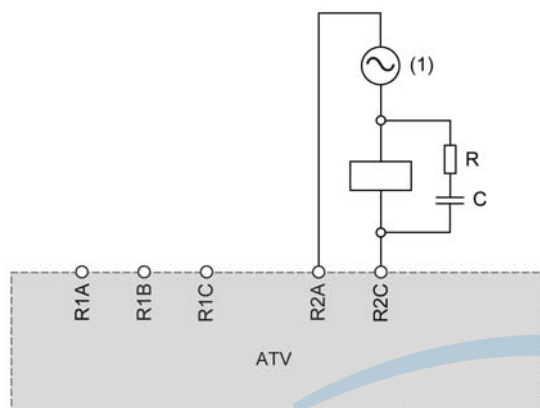

Output Relay with Inductive AC Loads

General

The AC voltage source must be of overvoltage category II (OVC II) according to IEC61800-5-1. If it is not the case an insulation transformer must be used.

Contactors with AC Coil

If controlled by relay, a resistor-capacitor (RC) circuit must be connected in parallel to the coil of the contactor, as shown on the drawing below.

(1) AC 250 Vac maxi.

Schneider Electric AC contactors have a dedicated area on the housing to plug easily the RC device. Refer to the Motor control and protection components catalog [MKTED210011EN](#) available on [se.com](#) to find the RC device to be associated with the contactor used.

Example: With a 48 Vac source, contactors [LC1D09E7](#) or [LC1DT20E7](#) have to be used with [LAD4RCE](#) voltage suppression device.

Other Inductive AC Loads

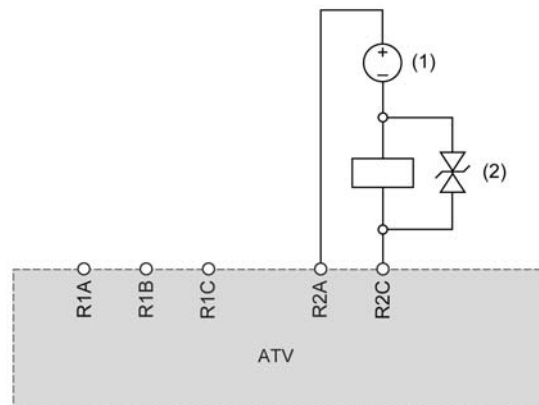

For other inductive AC loads...

- Use an auxiliary contactor connected on drive to control the load.
Example: with a 48 Vac source, auxiliary contactors [CAD32E7](#) or [CAD50E7](#) with [LAD4RCE](#) voltage suppression device.
- When using a third party inductive AC load, request the supplier to provide information on the voltage suppression device, in order to avoid overvoltage above 375 V during relay opening.

Output Relay with Inductive DC loads

Contactors with DC Coil

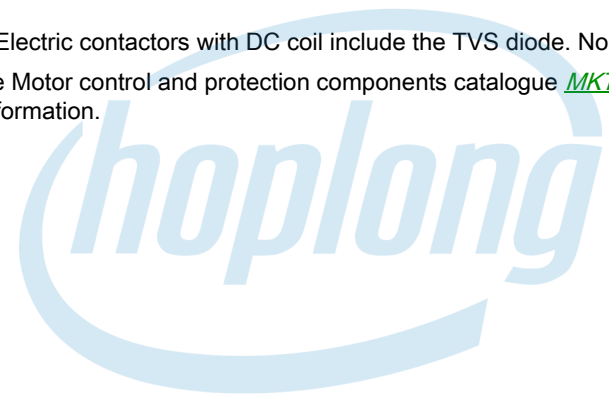

If controlled by relay, a bidirectional transient voltage suppression (TVS) diode, also called transil, must be connected in parallel to the coil of the contactor, as shown on the drawing below.

- (1) DC 30 Vdc maxi.
- (2) TVS diode

Schneider Electric contactors with DC coil include the TVS diode. No additional device is required.

Refer to the Motor control and protection components catalogue [MKTED210011EN](#) available on [se.com](#) for more information.

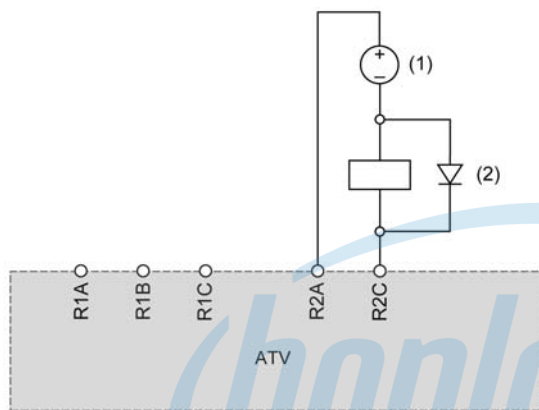

INDUSTRIAL AUTOMATION

Other Inductive DC Loads

Other inductive DC loads without embedded TVS diode must use one of the following voltage suppression device:

- A bidirectional TVS device as shown on the drawing above, defined by...
 - TVS break-down voltage greater than 35 Vdc,
 - TVS clamping voltage V(TVS) less than 50 Vdc
 - TVS peak power dissipation greater than load rated current, $I(\text{load}) \times V(\text{TVS})$.
Example: with $I(\text{load}) = 0.9 \text{ A}$ and $V(\text{TVS}) = 50 \text{ Vdc}$, TVS peak power must be greater than 45 W
 - TVS average power dissipation greater than the value calculated by the following $0.5 \times I(\text{load}) \times V(\text{TVS}) \times \text{load time constant} \times \text{number of operation per second}$.
Example: with $I(\text{load}) = 0.9 \text{ A}$ and $V(\text{TVS}) = 50 \text{ Vdc}$, load time constant = 40 ms (load inductance divided by load resistance) and 1 operation every 3 s, the TVS average power dissipation must be greater than $0.5 \times 0.9 \times 50 \times 0.04 \times 0.33 = 0.3 \text{ W}$.
- A fly-back diode as shown in the drawing below.

- (1) DC 30 Vdc maxi.
 (2) Flyback diode

The diode is a polarized device. The fly-back diode must be defined by...

- a reverse voltage greater than 100 Vdc,
- a rated current greater than two times the load rated current,
- a thermal resistance: junction to ambient temperature (in K/W) less than $90 / (1.1 \times I(\text{load}))$ to operate at maximum 60°C (140°F) ambient temperature.

Example: with $I(\text{load}) = 1.5 \text{ A}$, select a 100 V, 3 A rated current diode with a thermal resistance from junction to ambient less than $90 / (1.1 \times 1.5) = 54.5 \text{ K/W}$.

Using a flyback diode, the relay opening time will be longer than with a TVS diode.

NOTE: Use diodes with leads for easy wiring and keep at least 1 cm (0.39 in.) of leads at each side of the case of the diode for a correct cooling.

Chapter 5 Checking Installation

Before Switching On

The safety function STO (Safe Torque Off) does not remove power from the DC bus. The safety function STO only removes power to the motor. The DC bus voltage and the mains voltage to the drive are still present.

 DANGER
HAZARD OF ELECTRIC SHOCK
<ul style="list-style-type: none"> Do not use the safety function STO for any other purposes than its intended function. Use an appropriate switch, that is not part of the circuit of the safety function STO, to disconnect the drive from the mains power.
Failure to follow these instructions will result in death or serious injury.

Unsuitable settings or unsuitable data or unsuitable wiring may trigger unintended movements, trigger signals, damage parts and disable monitoring functions.

 WARNING
UNANTICIPATED EQUIPMENT OPERATION
<ul style="list-style-type: none"> Only start the system if there are no persons or obstructions in the zone of operation. Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation. Do not operate the drive system with unknown settings or data. Verify that the wiring is appropriate for the settings. Never modify a parameter unless you fully understand the parameter and all effects of the modification. When commissioning, carefully run tests for all operating states, operating conditions and potential error situations. Anticipate movements in unintended directions or oscillation of the motor.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the power stage is disabled unintentionally, for example, as a result of power outage, errors or functions, there is a possibility that the motor is no longer decelerated in a controlled way.

 WARNING
UNANTICIPATED EQUIPMENT OPERATION
Verify that movements without braking effect does not result in unsafe conditions.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Mechanical Installation

Verify the mechanical installation of the entire drive system:

Step	Action	✓
1	Does the installation meet the specified distance requirements?	
2	Did you tighten all fastening screws with the specified tightening torque?	

Electrical installation

Verify the electrical connections and the cabling:

Step	Action	✓
1	Did you connect all protective ground conductors?	
2	The correct tightening of the screws may be altered during assembly and wiring phases of the drive. Verify and adjust the tightening of all terminal screws to the specified nominal torque.	
3	Do all fuses and circuit breaker have the correct rating; are the fuses of the specified type? (refer to the information provided in the ATV340 Getting Started Annex (SCCR), catalog number NVE37641 for UL/CSA compliance and also in the Catalog (see page 10) for IEC compliance.	
4	Did you connect or insulate all wires at the cable ends?	
5	Did you properly connect and install all cables and connectors?	
6	Did you properly connect the signal wires?	
7	Are the required shield connections EMC-compliant?	
8	Did you take all measures for EMC compliance?	

Covers And Seals

Verify that all devices, doors and covers of cabinet are properly installed to meet the required degree of protection.

Chapter 6 Maintenance

What Is in This Chapter?

This chapter contains the following topics:

Topic	Page
Scheduled Servicing	145
Long-term Storage	147
Decommissioning	147
Additional Support	147

Scheduled Servicing

Serviceable products

The drives of frame sizes 1...3 are not serviceable products.

For drives of frame sizes 4 and 5 servicing, please refer to your Customer Care Center.

Servicing

  **DANGER**

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Read and understand the instructions in **Safety Information** chapter before performing any procedure in this chapter.

Failure to follow these instructions will result in death or serious injury.

The temperature of the products described in this manual may exceed 80 °C (176 °F) during operation.

 **WARNING**

HOT SURFACES

- Ensure that any contact with hot surfaces is avoided.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the product has sufficiently cooled down before handling it.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

⚠ WARNING

INSUFFICIENT MAINTENANCE

Verify that the maintenance activities described below are performed at the specified intervals.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Adherence to the environmental conditions must be ensured during operation of the drive. In addition, during maintenance, verify and, if appropriate, correct all factors that may have an impact on the environmental conditions.

	Part concerned	Activity	Interval (1)
Overall condition	All parts such as housing, HMI, control block, connections, etc.	Perform a visual inspection	At least every year
Corrosion	Terminals, connectors, screws, EMC plate	Inspect and clean if required	
Dust	Terminals, fans, cabinet air inlets and air outlets, air filters of cabinet	Inspect and clean if required	
Cooling	Fan	Verify the fan operation	At least every year
Fastening	All screws for electrical and mechanical connections	Verify tightening torques	At least every year

(1) Maximum maintenance intervals from the date of commissioning. Reduce the intervals between maintenance to adapt maintenance to the environmental conditions, the operating conditions of the drive, and to any other factor that may influence the operation and/ or maintenance requirements of the drive.

NOTE: The fan operation depends on the drive thermal state. The drive may be running and the fan not. Fans may continue to run for a certain period of time even after power to the product has been disconnected.

⚠ CAUTION

RUNNING FANS

Verify that fans have come to a complete standstill before handling them.

Failure to follow these instructions can result in injury or equipment damage.

Diagnostic And Troubleshooting

Refer to the ATV340 Programming Manual (*see page 10*) available on www.schneider-electric.com.

Spares and repairs

Serviceable products: Please refer to your Customer Care Center on:

www.schneider-electric.com/CCC.

Long-term Storage

Capacitor Reforming

If the drive was not connected to mains for an extended period of time, the capacitors must be restored to their full performance before the motor is started.

NOTICE

REDUCED CAPACITOR PERFORMANCE

- Apply mains voltage to the drive for one hour before starting the motor if the drive has not been connected to mains for the following periods of time:
 - 12 months at a maximum storage temperature of +50°C (+122°F)
 - 24 months at a maximum storage temperature of +45°C (+113°F)
 - 36 months at a maximum storage temperature of +40°C (+104°F)
- Verify that no Run command can be applied before the period of one hour has elapsed.
- Verify the date of manufacture if the drive is commissioned for the first time and run the specified procedure if the date of manufacture is more than 12 months in the past.

Failure to follow these instructions can result in equipment damage.

If the specified procedure cannot be performed without a Run command because of internal mains contactor control, perform this procedure with the power stage enabled, but the motor being at standstill so that there is no appreciable mains current in the capacitors.

Decommissioning

Uninstall the Product

Observe the following procedure when uninstalling the product.

- Switch off all supply voltage. Verify that no voltages are present - refer to Safety Information chapter (*see page 5*).
- Remove all connection cables.
- Uninstall the product.

End of Life

The components of the product consist of different materials which can be recycled and which must be disposed of separately.

- Dispose of the packaging in compliance with all applicable regulations.
- Dispose of the product in compliance with all applicable regulations.

Refer to Green Premium section (*see page 22*) for information and documents on environmental protection such as EoLI (End of Life instruction).

Error

Discrepancy between a detected (computed, measured, or signaled) value or condition and the specified or theoretically correct value or condition.

F

Factory setting

Factory settings when the product is shipped

Fault

Fault is an operating state. If the monitoring functions detect an error, a transition to this operating state is triggered, depending on the error class. A "Fault reset" is required to exit this operating state after the cause of the detected error has been removed. Further information can be found in the pertinent standards such as IEC 61800-7, ODVA Common Industrial Protocol (CIP).

Fault reset

A function used to restore the drive to an operational state after a detected error is cleared by removing the cause of the error so that the error is no longer active.
